

Harnessing Plant Immunity for Durable Clubroot Resistance

Clubroot Steering Committee

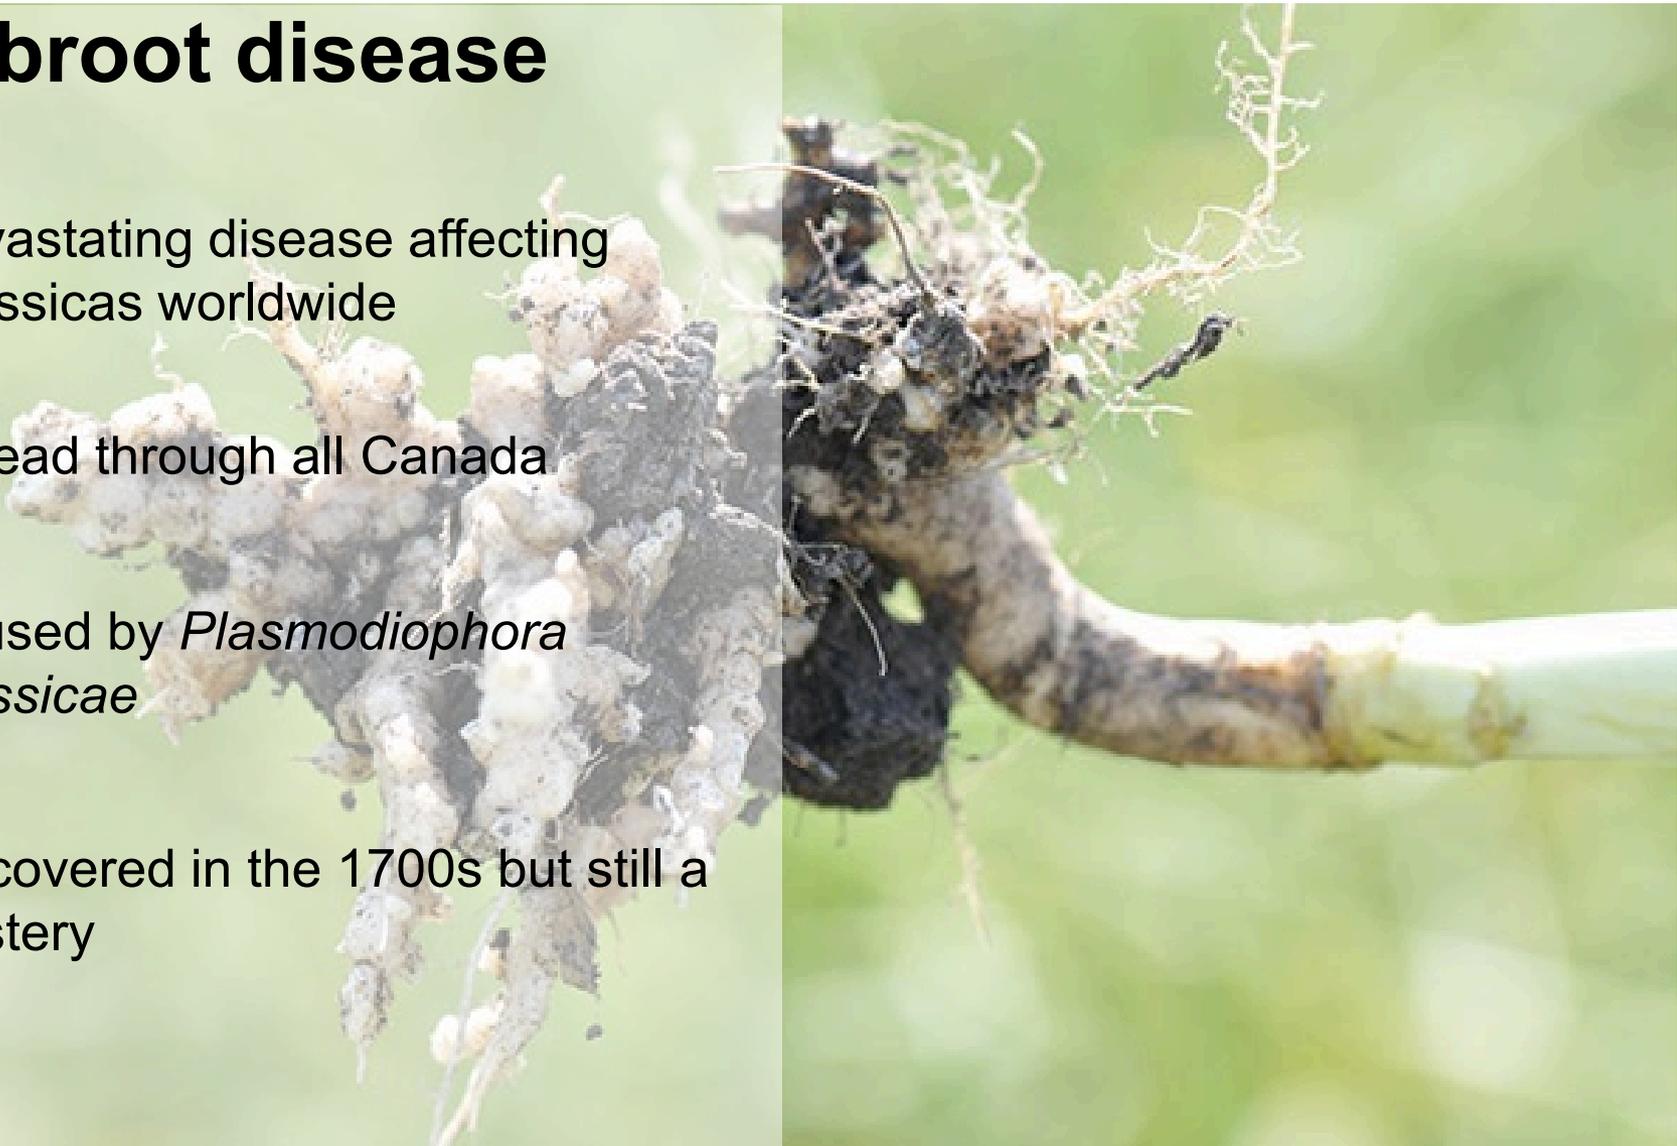

Edel Pérez-López, Ph.D.
Assistant Professor, University Laval

April 30th, 2020

Clubroot disease

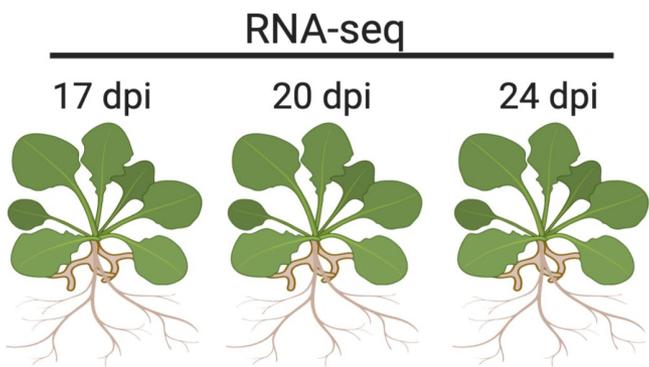

- Devastating disease affecting Brassicas worldwide
- Spread through all Canada
- Caused by *Plasmodiophora brassicae*
- Discovered in the 1700s but still a mystery

Pb candidate effectors

Expression

Signal peptide

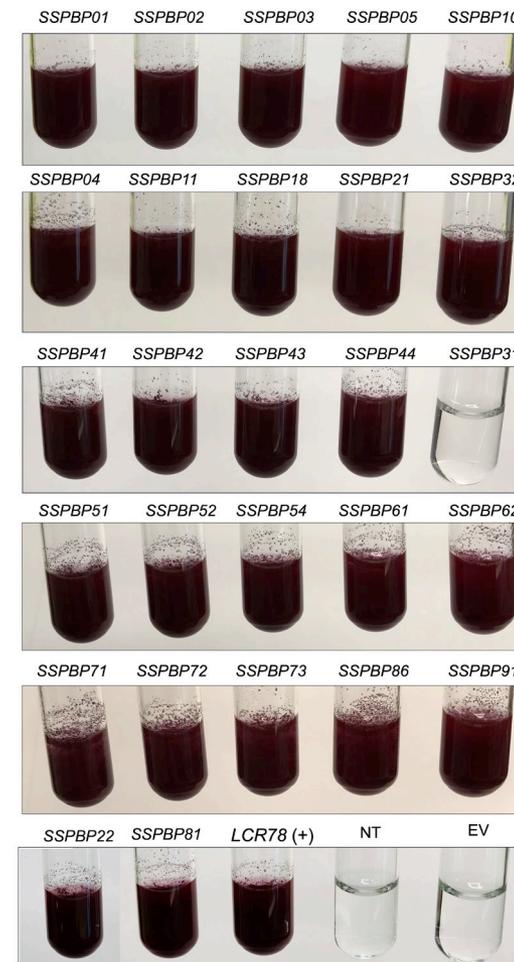

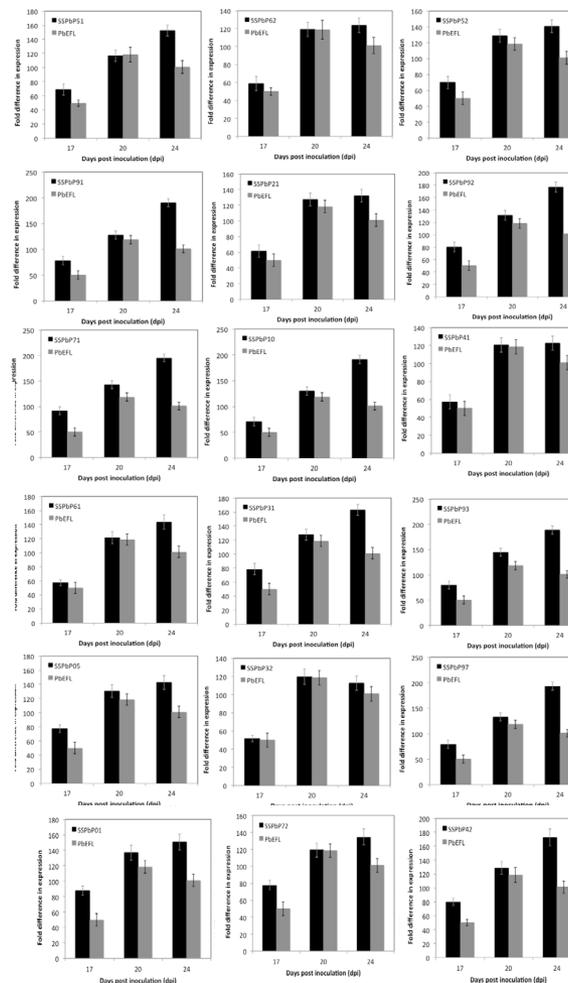

Pb proteins
≤ 400 aa

Signal peptide
No transmembrane
domain

Fungi and oomycetes effector
domains

32 SSPbPs

Confirmatory Analysis

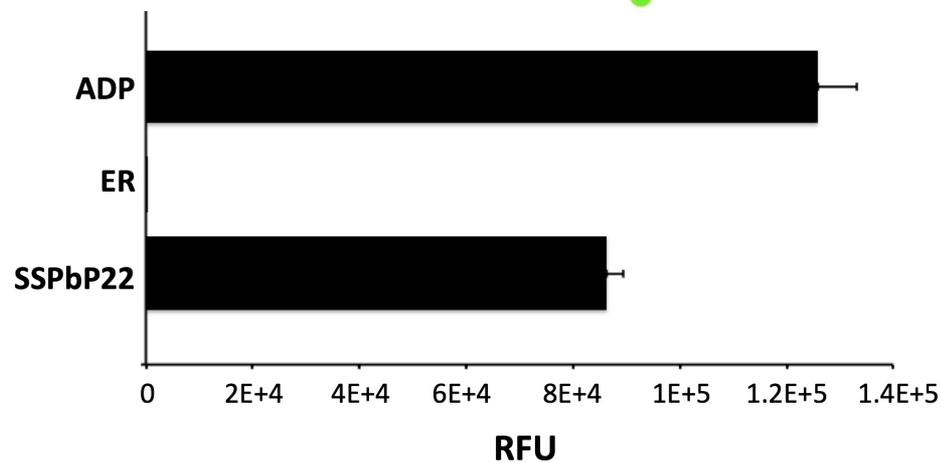

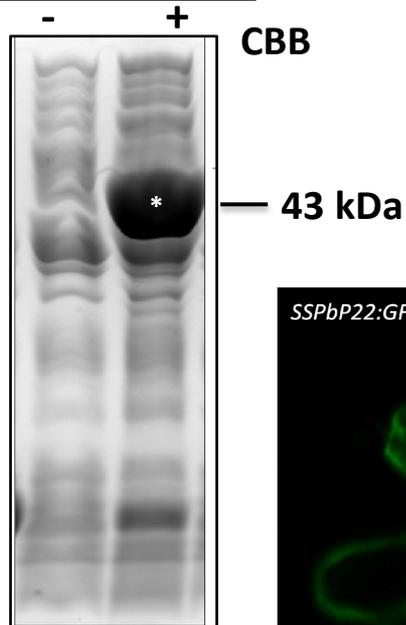

Is SSPbP22 a cytoplasmic and nuclear kinase

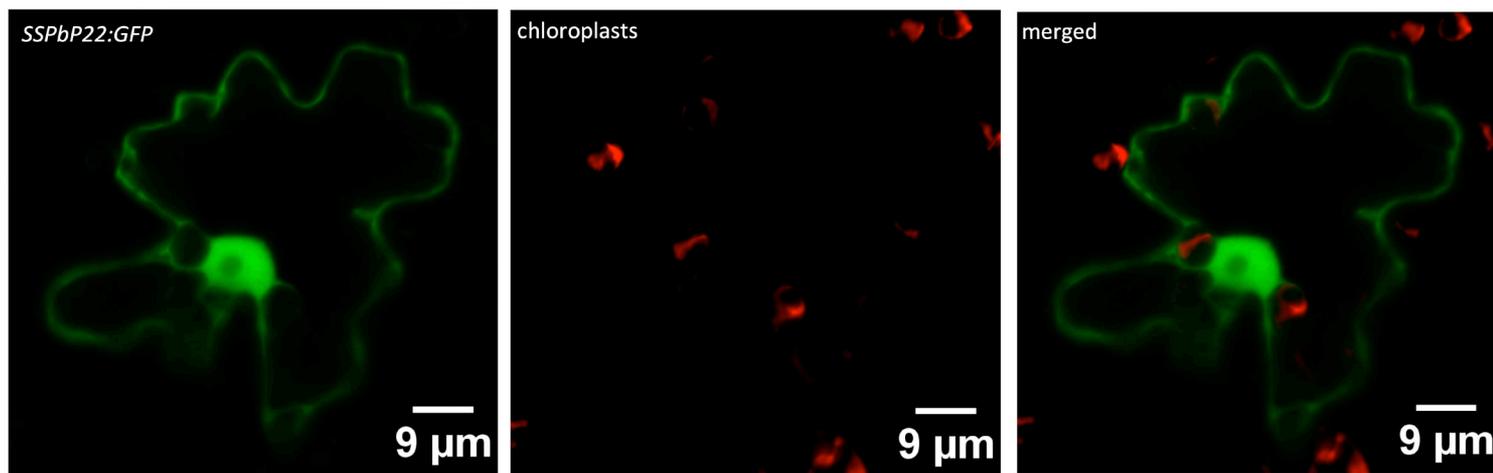

His SSPbP22

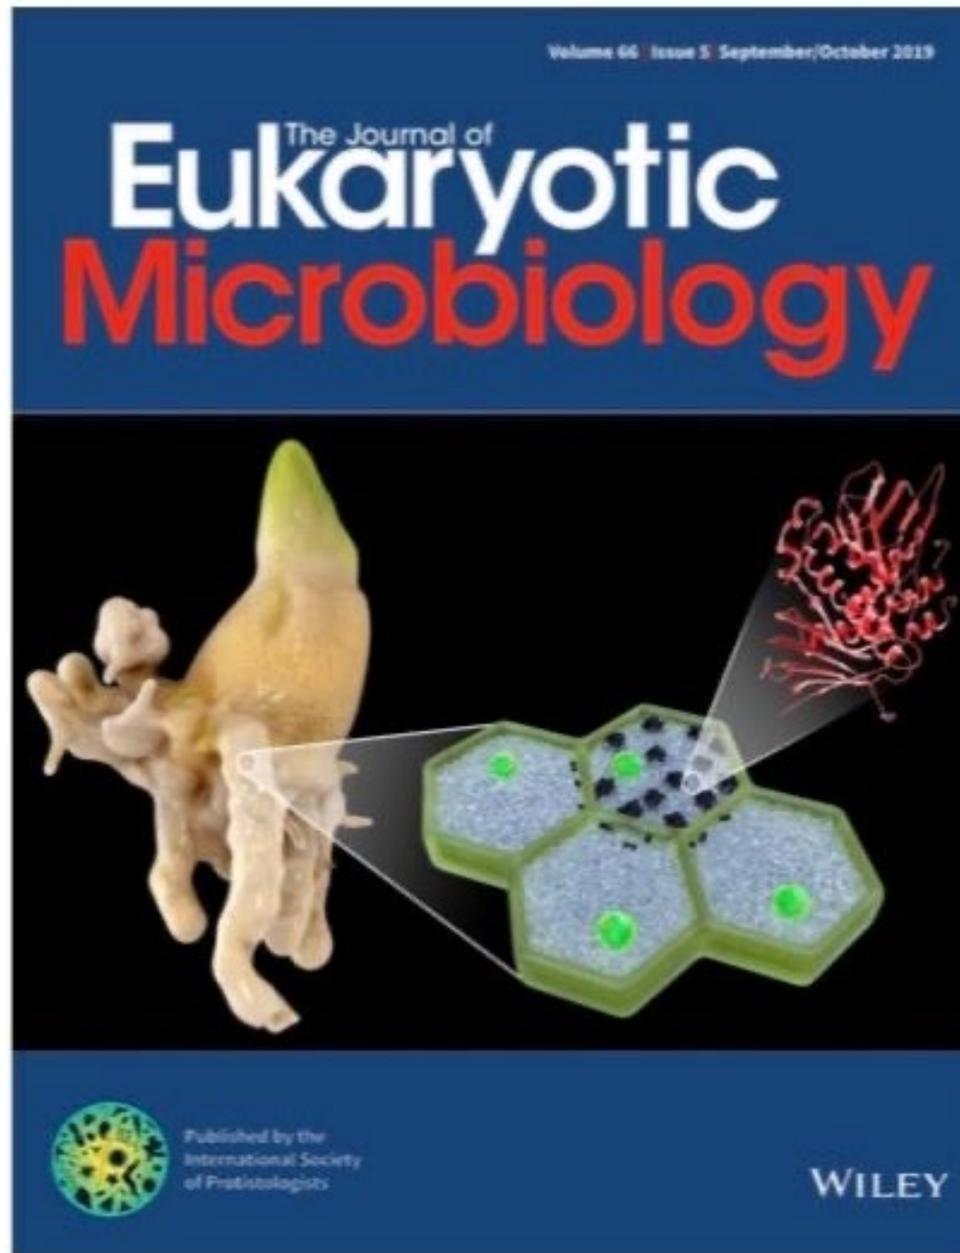

Arabinose 0.02%

35S SSPbP22 GFP

Cover May/June issue

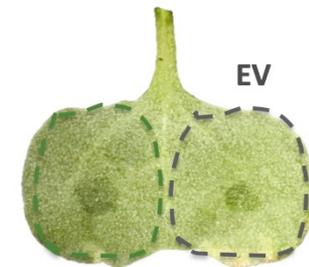

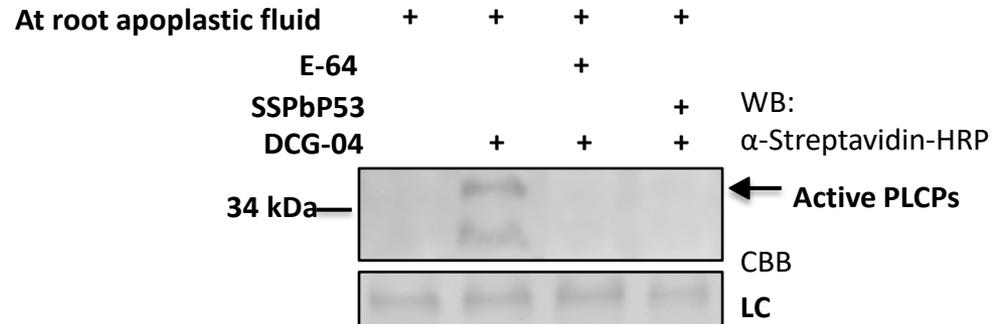

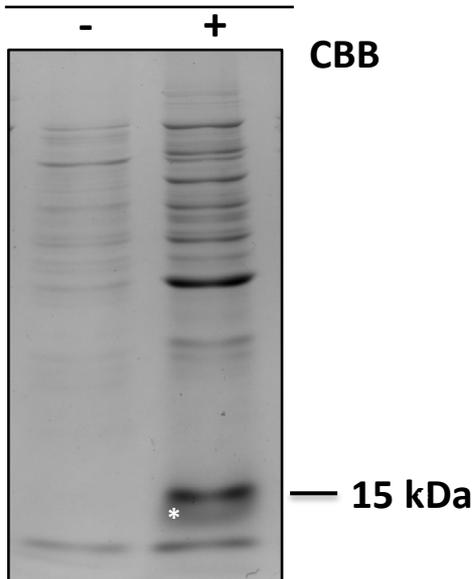

Faculté des sciences de l'agriculture et de l'alimentation
Département de phytologie

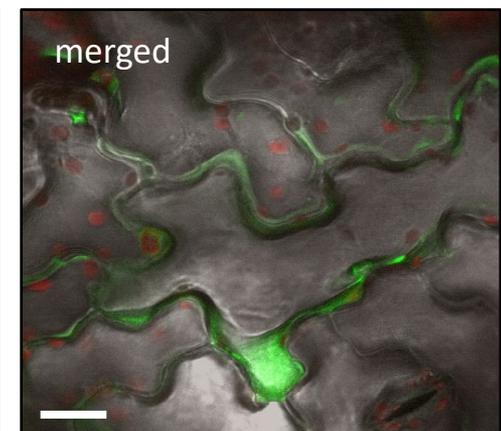

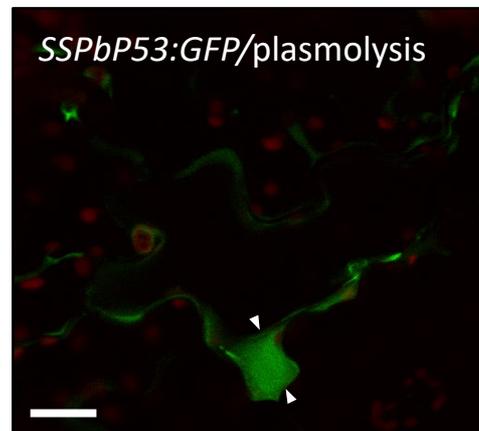

SSPbP53 is a cysteine protease inhibitor

Arabinose 0.02%

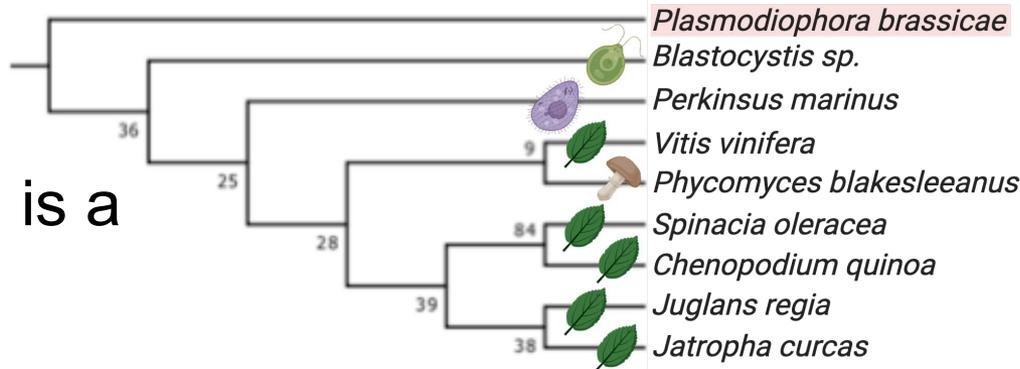

35S::SSPbP53::GFP

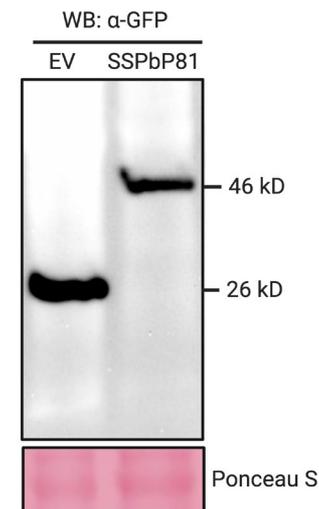

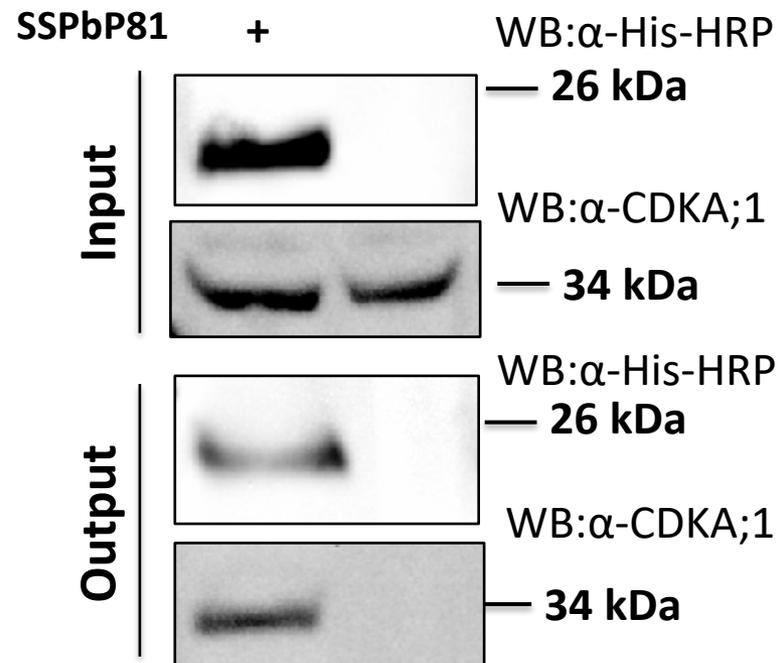

Faculté des sciences de l'agriculture et de l'alimentation
Département de phytologie

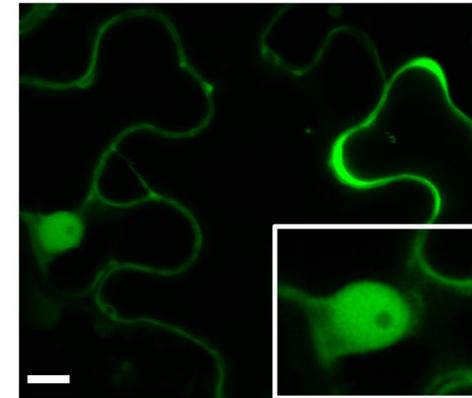

SSPbP81 is a cyclin

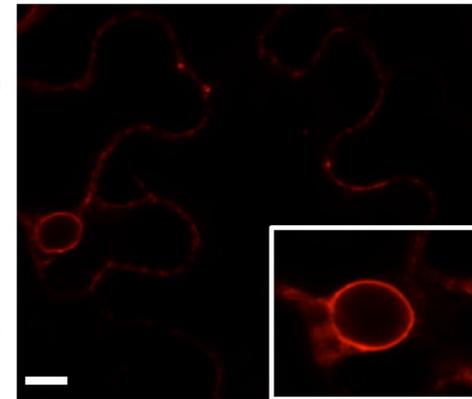

At Total Protein

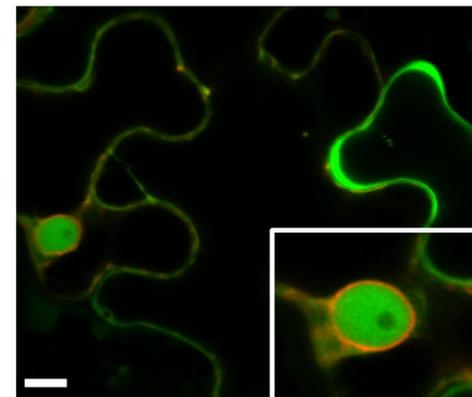

SSPbP81:GFP

pBIN20:mCherry

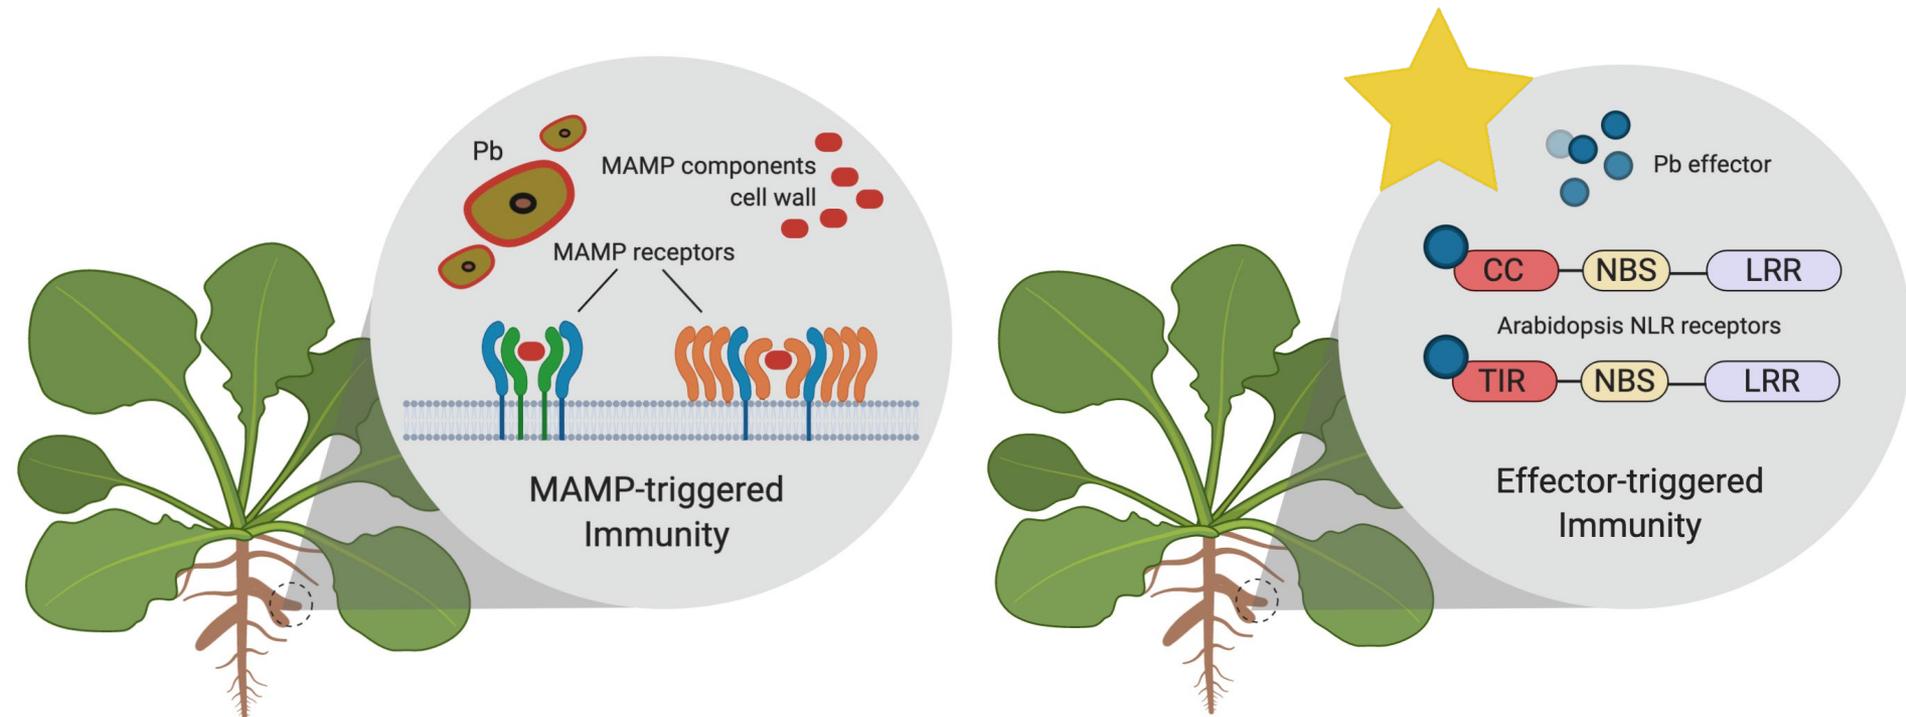

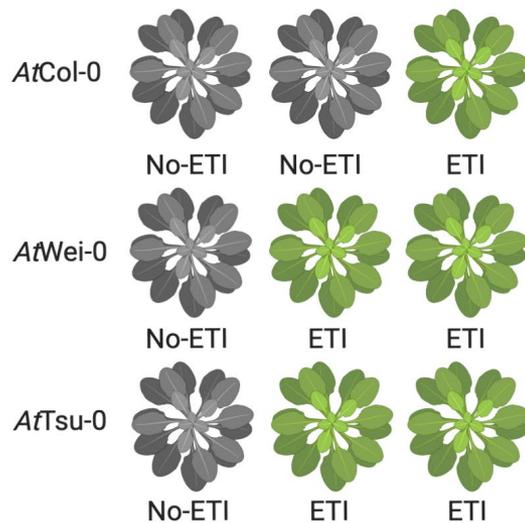

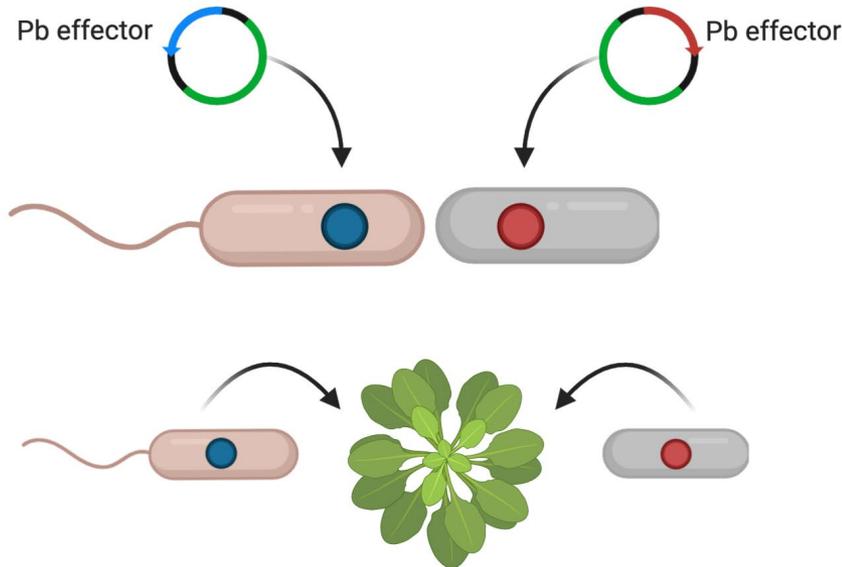

Merge

EdeLab

Improve plant resistance to *P. brassicae* through the elucidation of the mechanisms used by the clubroot pathogen to infect its hosts and to escape plant immunity

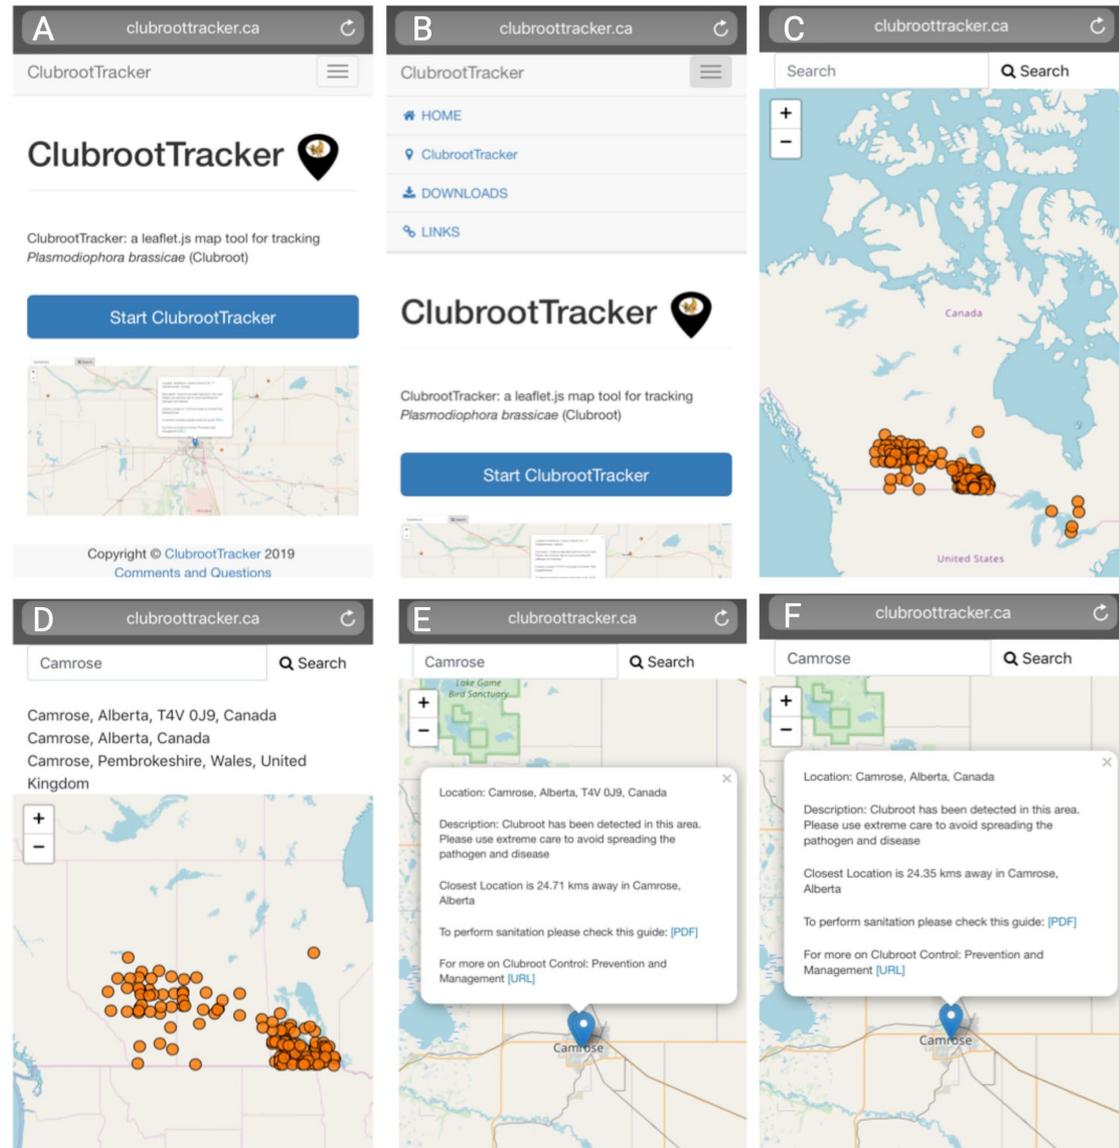

Screening of effector by effector without "bodyguard" mechanism interfering on the NLR receptors recognition of Pb effectors

Unveiling of new R genes sources of resistance that can be exploit to generate resistant canola

EdeLab

- Identification and characterization of *P. brassicae* affecting cruciferous crops in Mexico
- Expand the genomic information available for *P. brassicae*
- Will contribute to the identification of an accurate Pb effectoromic
